Resume the 1-Touch Restore job	53
Result	53

Introduction

Today 60% of enterprises are running Power/iSeries for their mission critical application and database. It is renowned for its reliability and stability and is deemed irreplaceable by many. There are however some issues:

- The veteran admins for Power/iSeries have been retiring and this has been an ongoing concern for IT departments.
- Older generations of Power hardware are becoming EOL and losing support
- IBM withdrew support for Power6 and Power7 in 2019.
- IBM i backs-up locally to tape creating silos of data requiring on-site expertise

Customers are trying to get out of the datacenter business and move to cloud, and with Power hardware becoming EOL now it is the perfect time to think about migrating these workloads to cloud.

This is where Commvault and Skytap come in, Skytap is the front end for Microsoft's Power offering.

- Skytap claims to provide a 40% TCO savings for Power servers moving to the Azure cloud (compute, storage, labor)

Commvault is the perfect method to migrate these workloads, provide data protection, enable multi-site replication and disaster recovery, automation, and above all simplicity.

This guide will cover the full process of migrating on-prem IBM i to Skytap. It includes best practices and optional steps to make the process smoother. Many of the steps must be performed by an IBM iSeries expert so do not attempt this process without the correct resources available.

This guide will assume an on-prem CommServe Server and MediaAgent (with a deduplicated storage pool) are already configured with Commvault 11.24 or later per the diagram below.

CommServe Server

Everything else will be deployed and configured using this guide.

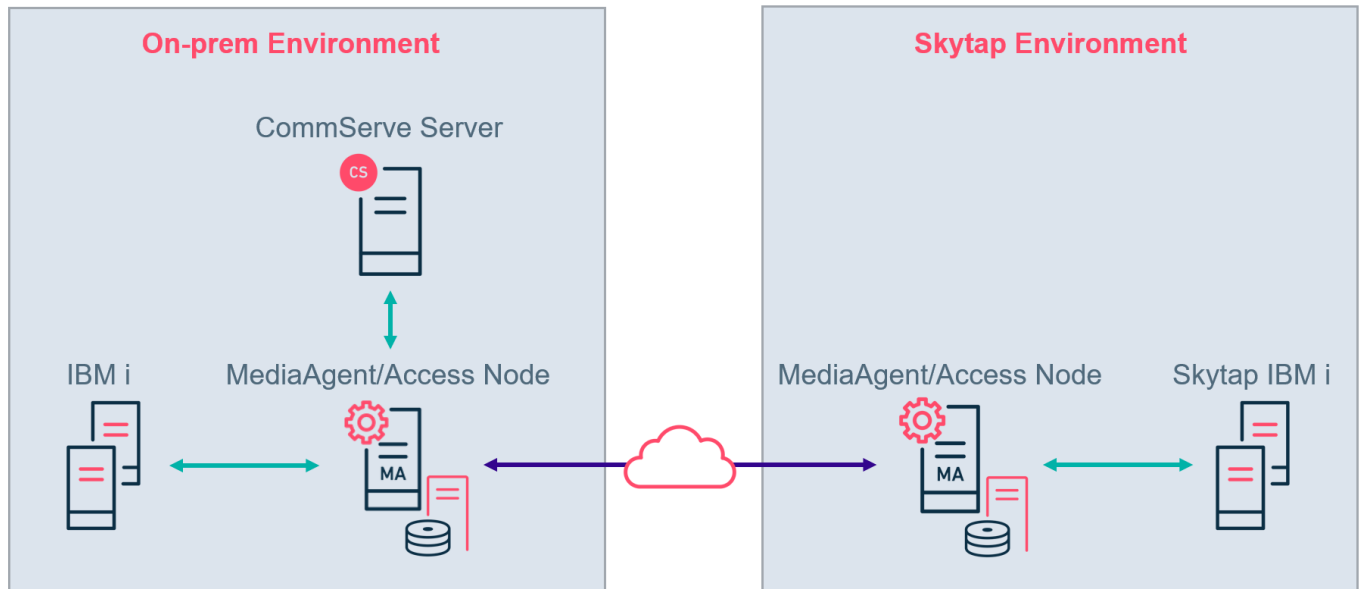

Disclaimer

This guide is accurate for the current release at the time of writing, FR11.24. It is to be used as a guideline, please ensure you fully understand the process and everything that is associated before usage. This process should not be attempted without an IBM i expert.

Solution Overview

Solution Architecture

This guide will use the architecture depicted below. This is just an example and Commvault can support any configuration provided an Access Node has direct communication with both source and destination IBM i Systems.

Systems

- CommServe Server
 - Orchestrates and monitors all jobs in this guide
 - Used to upload ISO image to Skytap
- On-prem MediaAgent/Access Node
 - Supported Linux Operating System (see documented system requirements on documentation.commvault.com)
 - Direct network (TCP/IP) communication with on-prem IBM i
 - Backup target for on-prem IBM i
 - DASH Copy Source
 - Network Gateway
 - Storage Accelerator (if Storage Pool is cloud based)
- On-prem IBM i
 - Migration Source
- Skytap MediaAgent/Access Node
 - Supported Linux Operating System (see documented system requirements on documentation.commvault.com)
 - Direct communication with Skytap IBM i
 - DASH Copy destination
 - Network Gateway
- Skytap IBM i
 - Migration Target

High Level Process

Pre-requisite: Install CommServe Server, MediaAgent, configure deduplicated Storage Pool following documentation best practices.

https://documentation.commvault.com/v11/essential/145241_migrating_on_premises_ibm_i_to_skytap.html

1. Install IBM i File System Agent on Media Agent
2. Optional: Create a plan for migration
3. Configure on-prem IBM i as an IBM i Client
4. Perform DR backup prerequisites on IBM i
5. Run IBM i Disk Space Report
6. Apply additional setting (SingleDVDImage)
7. Perform an IBM i backup of the DR Subclient.
8. Perform an IBM i backup of all non-DR subclients.
9. Create and deploy MediaAgent (with appropriate storage) on Skytap
10. Create a deduplicated storage pool on Skytap MediaAgent
11. Create a secondary copy for the non-DR Backup subclients pointing to the Skytap storage pool
12. DASH copy subclient backups to Skytap MediaAgent
13. Create IBM i virtual machine in Skytap
14. Configure Skytap IBM i as an IBM i Client
15. Start 1-Touch Restore process from CommServe Server
 - a. Restore the DR Backup ISO to the Skytap MediaAgent
1-Touch restore job is suspended at this point
 - b. Upload the DR Backup ISO to Skytap (temporarily disabling the Skytap session timeout is required if the upload will take longer than 15min)
 - c. Change the VM hardware configuration to boot in *D Mode side – Manual*
 - d. Start the VM
 - e. As soon as the media icon is available on the VM, mount the ISO image
 - f. Restore the minimal operating system from the DVD image
 - g. Recover System Data and Commvault Libraries from the DR Backup
 - h. Power down the system
 - i. Change the VM hardware configuration to boot in *B Mode side – Normal*.
 - j. Power on the system and wait for it to boot.
 - k. Resume the 1-Touch restore job.

Commvault IBM I Data Protection

Commvault Configuration

Once configured an IBM i client will by automatically have seven data subclients and one DR subclient:

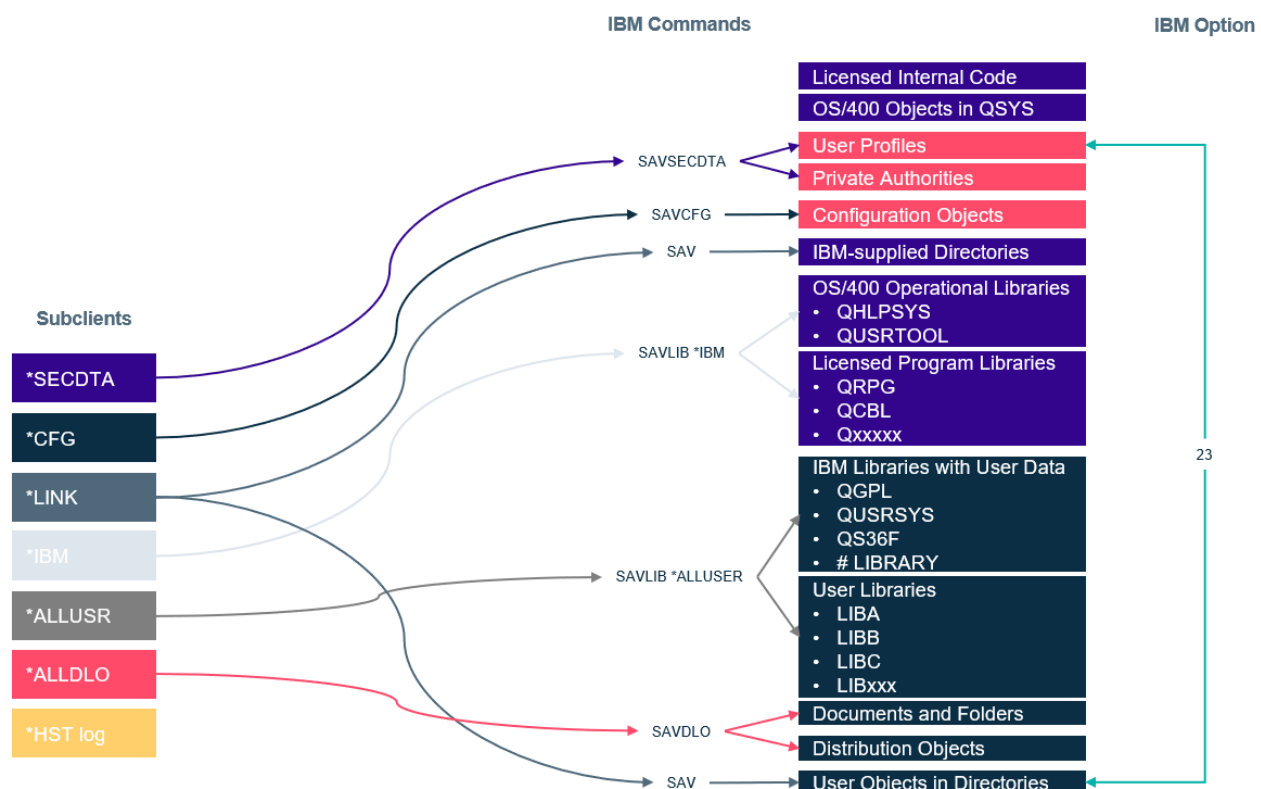

Subclient Name	Contents
*ALLDLO	All documents and folders
*ALLUSR	All user libraries
*CFG	The configuration objects
*HST log	The history logs
*IBM	All IBM supplied libraries
*LINK	The system directories, user directories, and the objects that the directories contain
*SECDTA	The security data
DR Subclient	Creates a bootable ISO with the contents mapped below

Anything not protected by these subclients will need to be added to a new custom subclient, so it can be migrated.

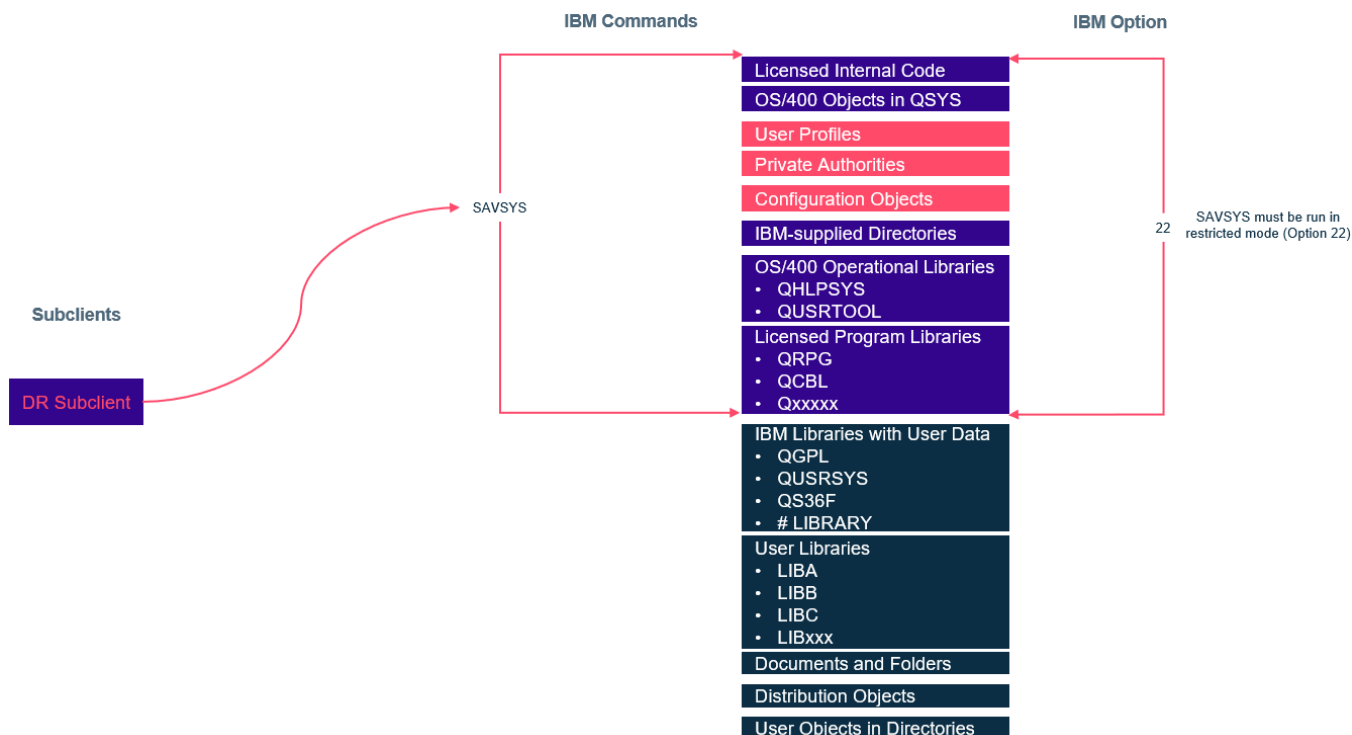

Subclient to IBM i Mapping

These diagrams show the data protected by each of the subclients, the IBM Command that is run to protect then, and the IBM option that is required. All subclients are pre-configured, these diagrams are just for awareness.

Data Subclients

DR Subclient

Job Steps

The following steps are automated

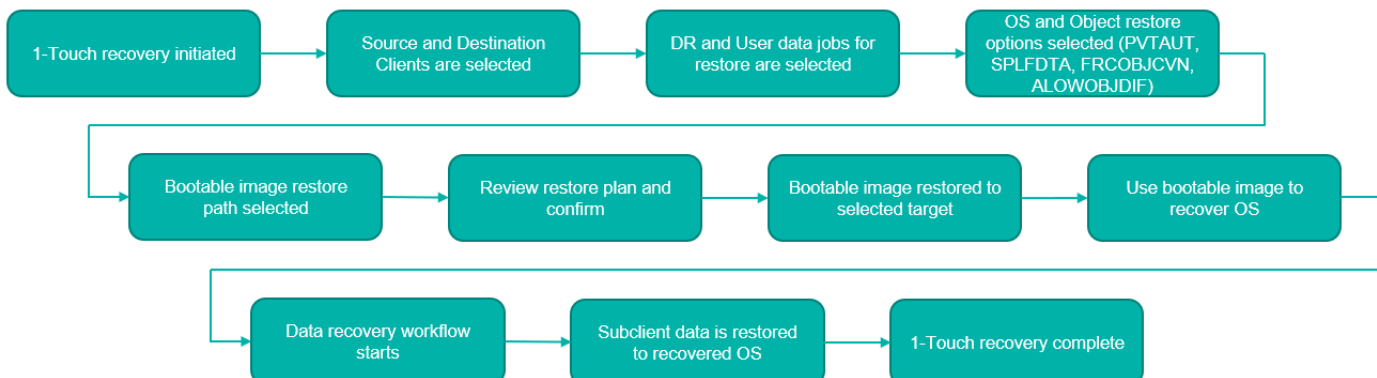

DR Backup

These steps happen in the background when the DR Subclient job runs

1-Touch Restore

Most of these steps are automated, anything requiring interactions is detailed in the guide.

Procedure

Machines

This guide will use the following machines (machine names are for illustration purpose only, actual machine/client name may be different)

Function	Client Name	Client Hostname
CommServe Server	dpr-cs11	dpr-cs11.lab.local
On-prem MA/Access Node	dpr-uxma01	dpr-uxma01.lab.local
On-prem IBM i	lpar6	lpar6.lab.local
Skytap MA/Access Node	st-uxma01	generated by Skytap on boot
Skytap IBM i	st-lpar6	10.0.0.2
IBM i User	CVBKP	

Install CommServe Server, On-Prem MediaAgent, and configure deduplicated Storage Pool

- This guide assumes the CommServe Server, and Linux MediaAgent have been pre-installed. We also assume, that a deduplicated storage pool has been created on the MediaAgent.
- This guide requires the Commserve, MediaAgents, Access Nodes all to be running Commvault FR 11.24+.
- The deduplicated storage pool should have sufficient free space to backup the whole IBM i that is being migrated.

Install IBM i File System Agent on Media Agent

1. Manage > Servers > Click the Actions button next to the MediaAgent > Add Software
2. Select the File System for IBM i package

Add software ⓘ

Select package(s) for UMA

File System for IBM i

☐

Reboot if required

☐

When the job completes, notify me via email

Equivalent API

Cancel

Install

3. Complete the installation
 - a. A download job will automatically be started if the software cache is missing the required packages

Create a plan for migration

1. Manage > Plans > Create plan > Server backup
2. Give it a name: *IBM i Data Subclients*

Plans

Create server backup plan

The screenshot shows the 'Create server backup plan' wizard in the Commvault interface. On the left, a vertical sidebar contains five steps: 1. General (highlighted with a red circle), 2. Backup destinations, 3. Recovery point objective, 4. Backup content, and 5. Options & restrictions. The main area is titled 'General' and contains two radio button options: 'Create a new plan' (selected) with the subtext 'New backup plan from scratch', and 'Use existing base plan' with the subtext 'Create plan by inheriting setting from base plan'. Below these options is a text field labeled 'Plan name *' containing the text 'IBM i Data Subclients'. At the bottom left is a 'CANCEL' button, and at the bottom right is a red 'NEXT' button.

3. Add storage pool from the on-prem MediaAgent
4. Set other options as desired

Configure on-prem IBM i as an IBM i Client

Pre-requisite: SSH and SFTP is required between the access node and the IBM i client, if this is not possible please see documentation for [manual steps](#) to deploy the CVINSTPKG.savf package after the client has been configured.

1. Protect > File Servers > Add Server > IBM i
2. Enter details of the IBM i we are going to protect

Add IBM i server

Server name

LPAR6

Host name

lpar6.lab.local

Commvault data path

/var/commvault

All specifications are subject to change without notice.

Perform DR backup prerequisites on IBM i

- These steps should be carried out by the IBM administrator
 - The goal of the prerequisites is to make the created ISO as small as possible by removing items unnecessary for restore, details can be found here:
https://documentation.commvault.com/v11/essential/108621_performing_ibm_i_file_system_dr_backups.html
 - After the backup succeeds, the following data is backed up in the format of bootable optical volumes:
 - SAVSYS
 - LIC - License internal code.
 - OS/400 Objects in QSYS
 - SAVSECDTA
 - User profiles
 - Private authorities
 - SAVCFG (configuration objects)
 - *IBM Libraries (system libraries)
 - System libraries with user data: QSYS2, QGPL, QUSRSYS
 - Commvault Libraries: CVLIB, CVLIBOBJ
 - System files and Commvault files with logs
 - /QIBM/ProdData
 - /QOpenSys/QIBM/ProdData
1. Do not create, or include the following under QGPL, QSYS2, and QUSRSYS libraries, if they are present and can be removed safely, please remove them:
 - a. Applied PTFs
 - b. Compiled programs
 - c. Image catalog
 - d. Journal or Journal receivers
 - e. OS related image catalog files
 - f. SAVF files
 - g. Spool output files
 2. Do not create any library starting with the letter 'Q'.

Run IBM i Disk Space Report

If there is an available Disk Space Report on the IBM i system, that was run within the last 3 days, this will be used to predict the size of the 1-Touch recovery DVD.

The Disk Space Report should be run/scheduled by an IBM i administrator and can take some time to run.

The backup job will verify if there is sufficient free disk space to run the 1-Touch backup. The job will fail if the free space is less than double the estimated DVD size.

Apply additional setting

This additional setting will create a single ISO image, instead of spanning the image over multiple ISOs.

Note: This is default behavior in FR11.26, so the additional setting is only needed in FR1124 and FR11.25 environments.

Additional Setting	SingleDVDImage
Description	Use this additional setting to create a single DVD image during an IBM i DR backup.
Category Type Value	ProxyClients Boolean TRUE
Where to apply	Source Access Node
URL	SingleDVDImage

Run IBM i Client Backups

1. Click Protect > File servers > LPAR6
2. Click Actions next to DR Subclient > Back up
3. Select Resume (*STSSBS) > OK
4. Once the backup is complete run Full backups for all other subclients

Recommendations:

- You can run *ALLDLO, *CFG, *HST Log, and *SECDTA simultaneously
- *IBM and *LINK should be run individually
- If *ALLUSR has very large libraries separate them into smaller subclients

Create and deploy MediaAgent (with appropriate storage) on Skytap

1. Login to Skytap
2. Environments > New environment
3. Select a template, for this guide we will use *CentOS 7.5 Server Firstboot*
4. Create Environment

Create a new environment

Select a template below to create a new environment.

My Company Skytap All

Sort by date created

CentOS 7.5 Server Firstboot

Project

Owner

Region: US-Virginia-M-1

CentOS 7.5 Server Firstboot

Last deployed: 6 days ago (created: 2 years ago) | Owner: Skytap | Region: US-Virginia-M-1

Storage: 30 GB | Metered RAM: 1 GB | Networks: 1 | Container hosts: No | Labels: 0

Attached licenses: N/A

VM	Status	Type	Storage	Metered RAM	Licenses	Endpoints
CentOS 7 Server x64	Powered off	x86	30 GB	1 GB	--	

5. Optional: Name your environment, and MediaAgent
6. Select VM settings
 - a. Network Adapters: Configure appropriate network interfaces
 - b. Hardware: Configure appropriate CPU, RAM, Disks (be sure to have enough free space for the backups and the ISO to be restored)In this guide we are using local disk on the Skytap MA, you can also use cloud storage but be aware of additional costs that may be incurred.

Compute

//gw/shared	10G	1.5G	8.6G	15%	/media/shared_drive
tmpfs	783M	0	783M	0%	/run/user/0

- Create appropriate network topologies to allow communication between on-premise and Skytap components
- Deploy the MediaAgent to the CommCell using best practices for your environment installing the *MediaAgent* and *File System for IBM i* packages at minimum.

Create a deduplicated storage pool on Skytap MediaAgent

1. Storage > Disk > Add
2. Give the Storage Pool a Name: *Skytap Migration Pool*
3. Add the storage and deduplication DB based on the previously configured mountpoints.

Add storage

MediaAgent

st-uxma01

+

Backup location

/store

☒ Use deduplication

Deduplication DB location

/ddb

4. Save

Create a secondary copy pointing to the Skytap storage pool

1. Manage > Plans > *IBM i Data Subclients*
2. Under Backup Destinations > Click Add > Copy
3. Enter copy details

Add copy

Name

Backups to copy

All Jobs

Retention rules

Retention period

1

Month(s)

☐

Extended Retention rules

4. Save

Copy jobs to Skytap MediaAgent

1. Plans will have an automatic schedule for Secondary copies
2. Click Jobs
3. After 5 min there should be an Auxiliary Copy running.
4. The Auxiliary copy can run while the next steps are being completed

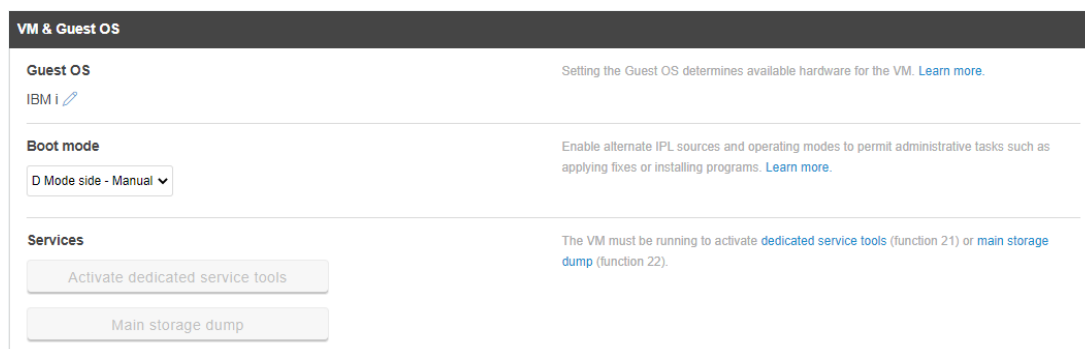

Create IBM i virtual machine in Skytap

1. In the Skytap environment > Click Add VMs
2. Select an appropriate IBM i template
3. Add VM(s)
4. Once created give it a name: *LPAR6M*
5. Edit the VM Settings

6. Hardware
7. Set the required RAM, CPU, Disks
8. Under VM & Guest OS
9. Set Boot mode to *D Mode side – Manual*

This will allow us to boot from the DVD

Configure Skytap IBM i as an IBM i Client

1. Protect > File Servers > Add Server > IBM i
2. Enter details of the IBM i we are going to restore to

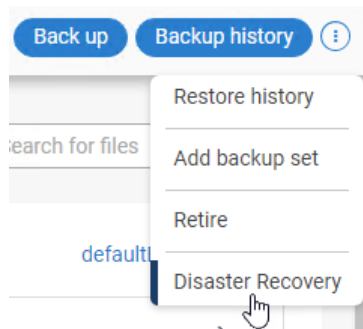

Add IBM i server ⓘ

Server name	LPAR6M
Host name	10.0.0.2
Commvault data path	/var/commvault
CVD port	9401
Plan ⓘ Optional	Click to select ▼
IBMi user credentials	
User name	CVBKP
Password
Confirm password
Access node client	st-uxma01 ▼
Subsystem description	QSYS/QSERVER
Job queue	QSYS/QPWFSEVER
	<input type="checkbox"/> Create job queue
Job priority	5
Run priority	50

3. Click Save

Start 1-Touch Restore process

1. Protect > File Servers > LPAR6 > Actions > Disaster Recovery

2. Fill in:
 - a. Destination Client
 - b. BackupSet to restore from
 - c. DR backup job to recover
 - d. Restore the DVD image to the Skytap MediaAgent
 - e. Select the Copy Precedence to restore from, we want to restore this data from the Skytap MediaAgent:
 - i. If using plans (as in this guide):
 1. Copy precedence 1 will be the default created snap copy on the local MediaAgent
 2. Copy precedence 2 will be on the local MediaAgent.
 3. Copy Precedence 3 will be on the Skytap MediaAgent

Disaster Recovery

Destination client	LPAR6M	▼
User data backupset	defaultBackupSet	▼
DR backup job to recover	1047233	▼
Client to restore DVD images	st-uxma01	▼
Destination path to store DVD images	/iso	
Copy precedence for restore jobs	3	
Log output destination	Optional	
<input type="checkbox"/> Restore SPLFTDA		

- ii. If using storage policies choose the appropriate copy precedence pointing to your Skytap copy.

3. Press Submit

1-Touch restore job is suspended at this point

At this point the IBM i DR Recovery Job will be suspended waiting on the restore of the ISO on the Skytap IBM i

Upload DR Backup ISO to Skytap

To upload the ISO we need a GUI and a browser, as the ISO resides on the Skytap MediaAgent, there is two options. The first being to install a GUI on the MediaAgent and upload directly, the second is to configure another VM with a GUI. This time we are going to

1. Create a new Windows server 2019 VM in the Skytap environment (any VM with a GUI/browser and SCP would work)

Add VM(s)

Cancel

Sort by date created ▾ ↓

Windows Server 2019 Standard Sysprepped

Last deployed: an hour ago (created: 23 days ago) | Owner: Skytap | Region: US-Virginia-M-1 |

15. Select the DASD option.

- a. If you have completed the DASD configuration, select the Keep the current disk configuration option (1).
- b. If you need to configure DASD, select one of the following:
 - i. Add all disk units to the system auxiliary pool
Select this option to add all non-configured disk units to the system auxiliary pool (ASP 1). Use this option when the system ASP has a few units and you have many non-configured units. All data stored on the units that are added will be deleted before adding units to the

system.

Note: This option will not balance data in the system ASP.

A series of screens display the status and any problems. If you see a problem screen, press F10. The process is complete when the "IPL step.....: Start the operating system" message appears.

- ii. Add all disks to the system ASP and balance data

This option adds all the non-configured disk units to the system ASP and then balances the data in the system ASP. Use this option when there are a few non-configured disk units, or when the system ASP contains many disk units. All data stored on the added units are deleted before they are added to the system ASP.

Note: You may have to wait for a few minutes with this option.

A series of screens display the status and any problems. If you see a problem screen, press F10. The process is complete when the "IPL step.....: Start the operating system" message appears.

This guide will add all disks to the system ASP and balance data (option 4)

Add All Disk Units to the System

System: J70466A0

Select one of the following:

1. Keep the current disk configuration
2. Perform disk configuration using DST
3. Add all disk units to the system auxiliary storage pool
4. Add all disk units to the system ASP and balance data

Selection

====> RSTLIB SAVLIB(CVLIB CVLIBOBJ) DEV(OPT06)_

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F23=Set initial menu

Check Optical Volume completed. 0 damaged files were found.

MA*  A                                20/047

```

PF13	PF14	PF15	PF16	PF17	PF18	Enter	Rule	EndFld	Erlnp	Reset	DUP ...
PF19	PF20	PF21	PF22	PF23	PF24	Clear	AltCur	ErFld	ErEOF	Next...	

There will be some file not found warnings press page down until at the end of the output to confirm the completion of the restore.

- Restore the system backup data. On the command line, type the following command, substituting OPTXX with the optical device name.

CVLIB/CSVSYRST DEV(OPTXX) VOL(*MOUNTED)

```

MAIN                                IBM i Main Menu                                System:  IBMIP9A

Select one of the following:

    1. User tasks
    2. Office tasks
    3. General system tasks
    4. Files, libraries, and folders
    5. Programming
    6. Communications
    7. Define or change the system
    8. Problem handling
    9. Display a menu

    11. IBM i Access tasks

    90. Sign off

Selection or command
====> CVLIB/CSVSYRST DEV(OPT06) VOL(*MOUNTED)_

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F23=Set initial menu

```

7. Have an IBM i admin configure the TCP/IP configuration from the command line.
8. Perform the initial program load (IPL). On the command line, type the following command:
PWRDWN SYS OPTION(*IMMED) RESTART(*YES)

```

TCPADM      TCP/IP Administration      System:  IBMIP9A

Select one of the following:

1. Configure TCP/IP
2. Configure TCP/IP applications
3. Start TCP/IP
4. End TCP/IP
5. Start TCP/IP servers
6. End TCP/IP servers
7. Work with TCP/IP network status
8. Verify TCP/IP connection
9. Start TCP/IP FTP session
10. Start TCP/IP TELNET session
11. Send TCP/IP spooled file

20. Work with TCP/IP jobs in QSYSWRK subsystem

Selection or command
====> PWRDWN SYS OPTION(*IMMED) RESTART(*YES)_

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel

MA*  A                                           21/045
PF13  PF14  PF15  PF16  PF17  PF18  Enter  Rule  EndFld  Erlnp  Reset  DUP ...
PF19  PF20  PF21  PF22  PF23  PF24  Clear  AltCur  ErFld  ErEOF  Next...

```

9. Press F16 to confirm (accessible by clicking the Next button at the bottom of the terminal)

Confirm Power Down of System

System : IBMIP9A

To confirm power down, press F16.
To cancel, press F12.

Bottom

F12=Cancel F16=Confirm

MA* A 01/001

PF13	PF14	PF15	PF16	PF17	PF18	Enter	Rule	EndFld	Erlnp	Reset	DUP...
PF19	PF20	PF21	PF22	PF23	PF24	Clear	AltCur	ErFld	ErEOF	Next...	

10. Select Option 1 and then perform the IPL following IBM documentation

IPL or Install the System

System: IBMIP9A

Select one of the following:

1. Perform an IPL
2. Install the operating system
3. Use Dedicated Service Tools (DST)
4. Perform automatic installation of the operating system
5. Save Licensed Internal Code

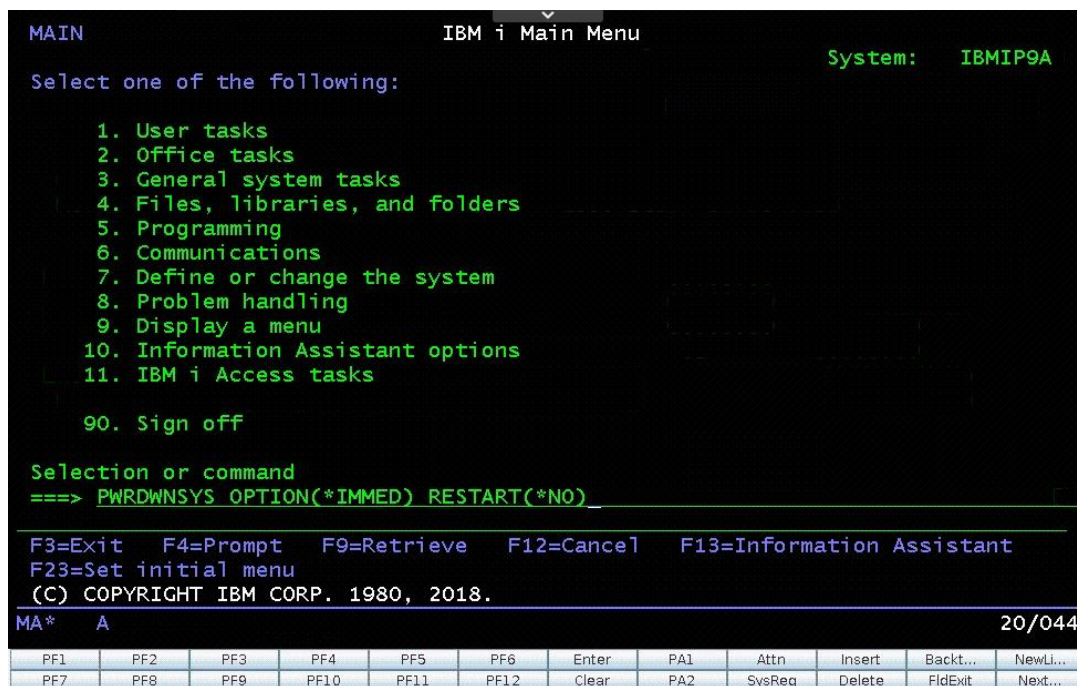

Selection
1

Licensed Internal Code - Property of IBM 5770-999 Licensed
Internal Code (c) Copyright IBM Corp. 1980, 2018. All

PF1	PF2	PF3	PF4	PF5	PF6	Enter	PA1	Attn	Insert	Backt...	NewLi...
PF7	PF8	PF9	PF10	PF11	PF12	Clear	PA2	SysReq	Delete	FldExit	Next...

11. After the IPL is complete power down the system
PWRDWSYS OPTION(*IMMED) RESTART(*NO)

12. Once the VM shows as powered off select the settings cog

13. Change the Boot mode to B Mode side - Normal

14. Power on the VM

15. Wait for the VM to boot and become operational.

Resume the 1-Touch Restore job

1. Click Jobs > press Actions on the IBM i DR Recovery job > Resume

2. This will trigger the restore jobs for the other subclients in order
3. Once the workflow has restored all the subclients, have an IBM admin IPL the system, and the migration is then complete.

Result

The migration process is now complete, you should have a replica of the on-prem IBM i running in Skytap.
